## REPORT AND NOTES.

---

**GENERAL.**—In addition to the Director, the Staff consists of Father J. P. Rowland, S.J., B.Sc., F.R.A.S., and Father B. G. Swindells, S.J., B.Sc., A.R.C.Sc., F.R.A.S. Mr. Joseph Burns, who has performed the duties of Meteorological Clerk for upwards of 30 years, has had to retire, owing to advancing years and indifferent health. The Observatory owes him a great debt of gratitude for his loyal and devoted service during all these years. His work was always performed with great conscientiousness and care; and he was always ready to help in every way in his power towards the general well-being of the Observatory. His place has been taken by Mr. Wilfrid Brown.

In the Spring most of the woodwork of the buildings was painted. In November Mr. R. Corless of the Meteorological Office, inspected our Meteorological instruments, and a certificate of their approval for use in the preparation of Official Publications of the Office was duly sent to the Director.

**METEOROLOGICAL.**—The Meteorological continuous records have been uninterrupted during the year. For a description of the instruments and for the values of their constants reference may be made to our Report for 1920, pp. v—vii. The Standard Barometer was restored to its original position, 381 feet above sea level on 1921, November 10th.

The dominating character of the weather on the whole was its dulness and mildness. There was a deficiency in sunshine in every month, except August, October and December. The rainfall exceeded the average for the last 79 years by 1.563 inches, with precipitation on 222 days. The greatest fall of rain in one day was on the 13th of October, when 2.020 inches were registered, one inch of which fell in one and a half hours. February, September, October and November were the wettest months of the year ; March, April, June and December the driest.

Fine day periods of five days or more were recorded as follows :—April 1—7, 9—14 ; May 15—24 ; June 1—7, 24—30 ; July 11—18 ; October 1—6, 17—24 ; December 20—27. A total of nine periods, with an average of 5.7 days each, as against a total of eight periods, with an average of 10.1 days each in 1925.

Bright sunshine for 10 hours or more was registered :—Three days in April, three days in May, four days in June, three days in July, three days in August, and one day in September, a total of 17 days. The days on which were recorded the greatest number of *continuous* hours of sunshine were : January 13 ; February 13, 28 ; March 10, 28 ; April 5, 11—13 ; May 3, 15, 16, 20, 22 ; June 1, 3, 5, 7, 29 ; July 1, 2, 14, 29 ; August 1, 17, 18, 27—29 ; September 18, 21, 22 ; October 18, 23, 26, 30, 31.

The adopted mean temperature for the year was  $47^{\circ}.9$ ,  $1^{\circ}.0$  above the normal. The highest shade temperature was  $82^{\circ}.8$ , on July 14, the lowest was  $23^{\circ}.2$ , on November 1. June, July and August were the warmest months ; January, February and December the coldest.

Gales of wind, 37 miles per hour and over occurred :— One in January, one in March, and two in November. The greatest velocity of the wind was on November 5th, which was registered at 46 miles per hour, in direction S.S.W.

**MAGNETICAL.**—Father Rowland has been responsible for the Magnetic Observations and Reductions. Absolute measures of Horizontal Magnetic Force have been made once each month by the method of Vibration and Deflection. The constants of the magnetometer needles were described in our 1921 Annual Report (p. vii). The Inclination is also measured, once each month, by two needles, with Dover's Circle, No. 159. The Declination is observed four times each month, at nearly equal intervals, and usually at 16 hours. The Differential Instruments, or Photo-Magnetographs, which have been in practically continuous action since the year 1866, are of the Kew Observatory pattern, except that the radial distances between the centres of the magnets and the surfaces of the respective cylinders are somewhat shorter, being 152·4 Cms. The time-scale is provided by cutting off the light every two hours, by means of an electro-magnet actuated from the Synchronome Clock. The scale values of the instruments are as follows :—

For the Unifilar ... 11·28' per Cm. of Ordinate.  
" Bifilar ... .000496 C.G.S. "

The Vertical Force Balance does not give sufficiently consistent readings to allow of numerical values being safely quoted, and the interpretation of its record is confined to estimates of greater or less disturbance.

Four daily readings are measured on the curves, the highest, the lowest, and those at the hours 4 and 16.

The absolute measures of Horizontal Direction and Force are corrected by the difference between the curve ordinate at the time of observation and the monthly mean of the four daily readings, according to the rule stated on page xii of our Report, 1908 ; and the month means are taken from the readings on the five quietest days of the month.

The Vertical and Total Forces are deduced from the measures of the Horizontal Force, and the angle of Inclination or Dip.

In the Table of Magnetic Disturbances (page 38) the intention is that a *calm* (c) shall mean a smooth curve ; *small* (s) a disturbance noteworthy only as opposed to a calm ; *moderate* (m) a disturbance not to be neglected for any comparison with other phenomena, solar or terrestrial ; *greater* (g) a marked disturbance ; and *very great* (v.g.) a decided storm.

Corresponding tabulations are sent quarterly to the Meteorological Institute at De Bilt (Holland), for the International Committee on Terrestrial Magnetism. In these the significant notes are restricted to three—0 (quiet), 1 (moderately disturbed), and 2 (highly disturbed). The character figures are assigned according to the scheme detailed in the Annuaire for 1918 of the Royal Dutch Meteorological Institute. From a comparison of these character letters with the figures published for each day from the central international station at De Bilt for the years 1921, 1922, the mean values of the figures corresponding to each letter are c—0·2, s—0·6, m—0·9, g—1·3, and v.g.—1·5. The civil day is used for both the international figures and for our own characteristic letters. The rule followed in

assigning these letters to denote the magnetic character of a day is as follows :—

From the measured ranges of D and H in minutes of arc on the five quietest days of a month a mean value is obtained of D and H combined. Similarly for each day of the month a mean value in minutes of arc of the range of D and H combined is set down. The excess of this mean daily range over the mean for the five quietest days gives the magnetic character of the day. The following values of the excess are adopted for the table of magnetic disturbances :—0 to 2 calm, 3 to 7 small, 8 to 15 moderate, 16 to 20 great, above 20 very great.

It follows from the nature of the process that these indications are not absolute, but relative to the mean amount of disturbance on the quiet days. It may happen also that a disturbance is classed as (v.g.) which can hardly claim the rank of a magnetic storm properly so called.

The mean daily ranges of Declination,  $7' \cdot 7$  for the quiet days, and  $14' \cdot 8$  for all days, and of Horizontal Force 34 for the quiet days, and 71 for all days (C.G.S. units), shew a decided increase on the corresponding values for 1925. The percentage of magnetically quiet days (c) was 31, as against 36 in the preceding year. These figures all shew a general increase in magnetic disturbance corresponding to the increased solar activity.

The mean magnetic characters of the various months, derived from the numerical values on the international scale referred to above, of the Stonyhurst letters m, g, v.g., point to February and September as

the most magnetically active months, and to August and November as the quietest. The following table exhibits a comparison of the Mean Daily Sunspot Areas with the Mean Daily Magnetic Character (1) including calms and small disturbances ; (2) excluding calms and small disturbances ( $c=0\cdot2$ ,  $s=0\cdot6$ ,  $m=0\cdot9$ ,  $g=1\cdot3$ , and  $v.g.=1\cdot5$  international scale).

MONTH	MEAN DAILY		SUN SPOT AREA.
	MAGNETIC CHARACTER. (1)	(2)	
January...	0·71	0·44	11·9
February	0·80	0·58	10·5
March ...	0·68	0·45	6·0
April ...	0·76	0·52	1·7
May ...	0·67	0·46	4·6
June ...	0·54	0·20	5·5
July ...	0·60	0·19	3·9
August ...	0·51	0·14	3·5
September ...	0·78	0·59	7·0
October ...	0·64	0·32	6·1
November ...	0·47	0·23	3·0
December ...	0·55	0·25	6·5

The greatest disturbances of the year occurred on January 26—27, February 23—24, April 14—15, October 15—16, with extreme ranges in D of 72', 72', 85', >164', and in H of 592, >404, 532, >652 $\gamma$ , respectively. "Sudden commencements" were noted on January 3rd, 23h. 23m., 12, 23h. 0m., 22, 15h. 38m., 25, 17h. 30m.; February 10, 5h. 48m., 23, 16h. 24m.; March 5, 10h. 5m., 17, 21h. 6m.; April 14, 14h. 3m., 21, 10h. 17m.; May 3, 2h. 12m.; June 1, 11h. 0m., 23, 12h. 58m.;

September 14, 8h. 44m., 17, 22h. 8m.; October 3, 0h. 34m., 11, 4h. 50m., 13, 19h. 25m.

**ASTRONOMICAL TIME SERVICE.**—The time service of the Observatory is under the charge of Father Rowland.

The radio time signals from the Eiffel Tower have been taken regularly throughout the year and the errors and rates of the sidereal and mean time clocks and chronometers determined from them. Time marks are made by the Synchronome Clock every minute on the Milne-Shaw Seismograph, and every two hours on the Magnetographs. The Synchronomic Seconds Dial has been giving some trouble during the year, several seconds being periodically dropped, and at other times gained. The trouble has, however, now been overcome; and since October the service has been quite satisfactory.

**SOLAR OBSERVATIONS.**—Observations of the solar surface were made on 281 days, and include 284 drawings. Of these drawings 244 are complete, and show all spots and faculae; of the remaining 40, 31 are complete for the spots.

The mean daily disc area of the spots (in units of  $1/5000$ th of the visible surface), stands at 5.33, as compared with 3.53 in 1925, and 1.36 in 1924.

The following table shows the distribution of spot-groups in the hemispheres at each revolution, with their maximum areas. The first revolution, starting on 1925, December 31.36, corresponds to Greenwich No. 967. The thirteenth revolution ended December 20.91.

The last column gives the sum of the Maximum Areas of all the Spots on the Sun during the revolution in question.

Revolution	Northern Hemisphere		Southern Hemisphere		Sum. of Max'm Areas
	No. of Groups	Max'm Areas	No. of Groups	Max'm Areas	
1. Dec. 31·36	10	33·1	8	14·9	48·0
2. Jan. 27·69	9	9·8	7	23·4	33·2
3. Feb. 24·04	10	5·5	13	26·1	31·6
4. March 23·38	9	6·0	17	6·2	12·2
5. April 19·64	12	5·3	9	14·0	19·3
6. May 16·87	14	8·2	12	9·8	18·0
7. June 13·08	14	15·8	14	3·0	18·8
8. July 10·27	13	4·4	8	14·5	18·9
9. Aug. 6·49	7	2·6	11	13·2	15·8
10. Sep. 2·23	12	22·5	12	5·1	27·6
11. Sep. 29·49	11	21·4	9	4·1	25·5
12. Oct. 27·29	12	5·1	9	7·0	12·1
13. Nov. 23·09	9	15·4	13	10·6	26·0
TOTAL . . .	142	155·1	142	151·9	307·0

Only two spotless days were observed—on July 17th and 18th.

On page 39, the horizontal lines indicate the beginning of a new revolution.

On pages 40—48 will be found the Sun-Spot Statistics for the year, as derived from our drawings.

SEISMOLOGICAL.—The Milne-Shaw seismograph has been in service throughout the year.

The total number of Earthquakes recorded during the year was 32, as against 55 in 1925, and 106 in 1924. They were distributed as follows :—

Jan.	Feb.	Mar.	April	June	July	Aug.	Sept.	Oct.	Nov.	Total
2	2	6	3	3	1	6	3	4	2	32

The most notable of these were on January 25th, February 8th, March 18th, June 26th, August 30th, October 3rd.

---

Our grateful thanks are tendered to the Governments, Institutions, Observatories, and individuals who have kindly contributed presentations to the Library during the year.

## DATES OF MAGNETIC DISTURBANCES.

The disturbances are divided generally into three classes, *small*, *moderate*, and *greater*; these are indicated by the initial letters of the classes, and the letter *c* denotes *calm*. Very great disturbances are marked v.g. The days are civil days.

## SUN-SPOT STATISTICS, 1926.

Any area less than 0·1 is entered as 0·0; s—chief spot, g—centre of group, p—preceding spot, f—following spot, indicate the points for which the co-ordinates were measured. In the last column is entered the day and decimal thereof on which the centre of the spot or groups passed the central meridian. The entry 'a' signifies that the spot appeared *after* the Central Meridian had been reached, 'b' that it disappeared *before* reaching it. An entry in *italics* denotes that the group almost certainly crossed the Central Meridian, but that either the last observation of the group was before it had crossed, or its first observation was after. An entry in brackets indicates that it is doubtful whether the group or spot crossed or not.
